

Ref 060301JW

Application Title

Detecting a Bottle in a Sealed Box.

Application Details

The customer packages bottles into individual cartons. Some occasions had arisen where empty cartons were placed back on the production line and were palletised along with the full product.

These end up at the POS and may lead to fines and product recalls.

Solution Provided

More Control supplied capacitive proximity sensors from the Rechner range. These sensors have twice the detecting range of standard units and also have a good resolution setting. This means that even small bottles in large boxes can be reliably detected.

This solution could even detect the difference between an empty packaged bottle and a full packaged bottle.
